Engrafting foreign replacement cells within a fetal non-human mammal, useful in producing chimeric mammals, comprises selectively destroying native cells in a tissue of a fetal non-human mammal host.

Disclosure; SEQ ID NO 3; 48pp; English.

replacement cells within a foetal non-human mammal, which comprises selectively destroying native cells in a tissue of a foetal non-human mammal host, where the number of maternal cells of the same tissue is not substantially reduced, and implanting foreign replacement cells in the tissue of the fetal non-human mammal host, where the foreign replacement cells replacement cells replacement and implanting foreign replacement cells in the tissue of the fetal non-human mammal host. The present invention describes a method for engrafting foreign

35 protein of Caenorhabditis elegans or a functional equivalent,
derivative or bioprecursor of UNC-53. Also described: (1) a DDNA e-
encoding a vertebrate homologue of the C. elegans UNC-53 protein; (2) a
nucleic acid which hybridises to the CDNA of (1); (3) vector comprising
the CDNA as in (1); (4) a homologue of the CDNA of (1); (3) vector comprising
a transgenic cell, tissue or animal comprising the vector as in (3); (6)
                                                                                                                                                                                                                                                                    9
                                                                                                                                                                                                                                                                                                     GACGGATCGGGAGATCTCCCGATCCCCTATGGTCGACTCTCAGTACAATCTGCTCTGATG 60
facilitating growth and differentiation of foreign cells within a mammalian host, and for producing chimeric mammals that can be used to develop new drugs and vaccine, factors, drugs and tissues for transplantation, also useful to study human diseases. The present sequence represents a nucleotide sequence given in the Sequence Listing of the present invention but not mentioned further within the

cell shape, motility, or the direction of cell migration of the regulation of cell shape, motility, or the direction of cell migration for use as a inhibitor or enhancer of regulation of cell behaviour, growth, shape or motility or the direction of migration by contacting a host cell ceresising a homologue of UNC-53 and determining a change of phenotype; (8) a method for identification of vertebrate homologues of C. elegans unc-53 gene by hybridising a probe of 15-50 bp of the unc-53 sequence to a DNA library; and (9) a method for identification of a protein which is active in the signal transduction pathway of a cell of which a vertebrate homologue of UNC-53 is a component comprising; (i) contacting an extract of a cell with an antibody to the UNC-53 homologue; (ii) identifying an antibody/homologue complex; and (iii) analysing such a complex to a cell migration and cell shape in C. elegans. Vertebrate homologues of UNC-53 can be used to promote neuronal regeneration, revascularisation or wound healing, to treat chronic neurodegenerative diseases or acute traumatic injuries or fibrotic diseases. The present sequence is used in the exemplification of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          engrafting foreign replacement cell; implanting foreign replacement cell; growth; differentiation; drug development; vaccine development; tissue transplantation; human disease study; cytomegalovirus; gene; ds.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           9

not
replacement cells within a foetal non-human mammal, which comprises selectively destroying native cells in a tissue of a foetal non-human mammal host, where the number of maternal cells of the same tissue is not substantially reduced, and implanting foreign replacement cells in the tissue of the fetal non-human mammal host, where the foreign replacement cells in the cells resplace destroyed cells of the tissue. The method is useful for facilitating growth and differentiation of foreign cells within a mammalian host, and for producing chimeric mammals that can be used to develop new drugs and vaccine, factors, drugs and tissues for transplantation, also useful to study human diseases. The present sequence represents a nucleotide sequence given in the Sequence Listing of the present invention but not mentioned further within the

useful in producing chimeric mammals, comprises selectively destroying native cells in a tissue of a fetal non-human mammal host. Engrafting foreign replacement cells within a fetal non-human mammal

Disclosure; SEQ ID NO 4; 48pp; English.

The present invention describes a method for engrafting foreign replacement cells within a foetal non-human mammal, which comprises selectively destroying native cells in a tissue of a foetal non-human mammal host, where the number of maternal cells of the same tissue is not substantially reduced, and implanting foreign replacement cells in the tissue of the fetal non-human mammal host, where the foreign replacement cells replacement cells replace destroyed cells of the tissue. The method is useful for facilitating growth and differentiation of foreign cells within a mammalian host, and for producing chimeric mammals that can be used to develop new drugs and vaccine, factors, drugs and tissues for transplantation, also useful to study human diseases. The present sequence represents a nucleotide sequence given in the Sequence Listing of the present invention but not mentioned further within the of the present specification.

                                                         This is the nucleotide sequence of pCTM, a plasmid which contains a CMV promoter, a tripartite adenovirus leader flanked by T7 and SP6 promoters, and a multiple cloning site with a bovine growth hormone polyA site and downstream SV40 polyA site. It has been used as a vector for the expression of fusion proteins of the invention that comprise retinoblastoma protein (BP, see AAW62465) and E2F transcription factor (see AAW62464). Such fusion proteins, particularly expressed from gene therapy vectors, are used to treat hyperproliferative conditions, specifically cancer (particularly of the bladder) or restenosis. They are more effective in repressing transcription of the E2F promoter than RB alone and cause cell-cycle arrest in a variety of cells. (Updated on 27-AUG-2003 to correct OS field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 9

This is the nucleotide sequence of pCTMIE, a plasmid that was constructed by amplifying the SV40 enhancer from SV40 viral DNA by PCK, digesting the amplified product with Bg11I and insertino BamHI-digested plasmid pCTMIE was been used as a vector for the expression of fusion proteins of the invention that comprise expression of fusion proteins of the invention that comprise testinoblashcoma protein (BP, see AAM62465) and ESF transcription factor (see AAM62464). Such fusion proteins, particularly expressed from gene therapy vectors, are used to treat hyperproliferative conditions, specifically cancer (particularly of the bladder) or resenosis. They are more effective in repressing transcription of the ESF promoter than RB alone and cause cell-cycle arrest in a variety of cells. (Updated on 27-
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  New fusion polypeptide of, e.g. transcription factor - used to treat, e.g. hyper-proliferative disease such as cancer and restenosis.

                                                                                                                                                                                                                                                                                                                                        This is the nucleotide sequence of pCTMI, a plasmid that was constructed from pCTM (see AAV40006) by digesting pCTM with XhoI and NotI and subcloning a 180 bp introm XhoI-NoII fragment from a pCMW-beta-gal vector. Plasmid pCTMI has been used as a vector for the expression of fusion proteins of the invention that comprise retinoblastoma protein (BP, see AAW62465) and B2F transcription factor (see AAW62464). Such fusion proteins, particularly expressed from gene therapy vectors, are used to treat hyperproliferative conditions, specifically cancer (particularly of the bladder) or restenosis. They are more effective in repressing transcription of the B2F promoter than RB alone and cause cell-cycle arrest in a variety of cells. (Updated on 27-AUG-2003 to correct os field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           1 GACGGAICGGGAGAICTCCCCGAICCCCTAIGGTCGACTCTCAGTACAATCTGCTCTGAIG 60

The invention relates to a nucleic acid construct for delivery into living cells in vivo, to induce an immune response to a disease peptide antigen, where the construct directs expression of a fusion protein comprising the peptide antigen and the first domain of FrC. Also included are a nucleic acid vector comprising the above construct or vector and a method of producing a nucleic acid construct for inducing an immune response. The method comprises identifying a nucleic acid sequence encoding a disease peptide comprises identifying a nucleic acid sequence encoding a disease peptide nucleic acid sequence, introducing the cloned nucleic acid into a vector which allows the antigen to be expressed as a fusion with a first domain FrC from tetanus toxin, and optionally isolating the construct from the vector. The construct or vector is used as a vaccine to induce an immune response, particularly to tumour antigens. The present sequence is vector
                                                                                                                                                                                                                                                  Cytostatic; vaccine; tetanus toxin; FrC; tumour; CTL; PCR primer; pVAC1;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Nucleic acid construct, useful to immunize against various diseases including cancer, expresses the first domain of tetanus toxin FrC fused to a disease peptide antigen to provide a vaccine.

commercially available vector pRC/RSV. Leader sequences and termination signals were introduced into the vector to allow for production of fusion proteins. The vector, pSIG/Not.Tagl, was modified to replace the pelb leader with the human immunoglobulin VH1 leader sequence that permits the encoding of an SfiI cloning site without modification of the amino acid sequence. This fragment was then cloned as an EcoRI/Blunt-HindIII fragment into NotI/Blunt-HindIII cut vector pRC/RSV to give pVACI. The single chain Fv for an individual patient can be inserted within the VH1 leader sequence. This plasmid when encoding a single chain murine

This sequence represents the vector pVAC1. This vector is based on the

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The invention relates to a novel nucleic acid construct for inducing an immune response in vivo to an antigen, capable of directing the expression of a fusion protein that comprises an antigen and an adjuvant sequence derived from a plant viral coat protein. The construct of the invention has cytostatic and virucide activity. The nucleic acid construct is useful for inducing an immune response in a patient, for construct is useful for inducing an infectious disease caused by an antigen vaccinating a patient against an infectious disease caused by an antigen derived from a pathogen e.g. a virus, for treating a cancer patient or a patient with a predisposition to cancer and for treating a patient having a B cell malignancy, where the construct is encapsidated, and optionally, a second nucleic acid sequence encoding a further immunomodulatory undicated to the patient. The construct is also useful in medical treatment, and in the preparation of a vaccine for treating or preventing a disease state associated with the antigen. The sequence

The specification describes a microsphere comprising dihydrazide derivatised hyaluronic acid crosslinked to a nucleic acid (NA). The microspheres cause reduced inflammatory responses, and have increased safety and biodegradability. The microspheres are useful for transfecting a cell of a subject and for treating a subject having myocardial ischemia, by increasing cardiac angiogenesis. They are also useful for treating hemophilia. The present sequence represents the plasmid pCDNA3.1/Gs, into which is inserted a polynucleotide sequence which is crosslinked to hyaluronic acid. The polynucleotide sequence encodes a vascular endothelial growth factor (VEGF)

The invention provides a nucleic acid molecule (I) comprising at least the functional part of blasticidin resistance (BS) gene, or its homolog, linked through a recognition sequence to at least one selected gene. (I) is useful in treatment comprising: (I) providing cells/tissues transfected with (I); (2) surgical administration of the cells/tissues to the patient to be treated; and optionally (3) monitoring the status of the cells/tissues by the patient. Therapeutic compositions comprising cells/tissues transformed with (I) is useful in identifying the role of genes in healthy and diseased tissue, in tissue engineering and in cosmetic surgery. Tissue engineering can be used to treat arthritis, joint replacement, skin grafts for burn victims, and replacement coronary arteries. Cosmetic tissue surgery includes rhinoplasty. The present sequence represents the nucleotide sequence of the vector pIRES/BS
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         fusion protein; amyloid precursor protein; APP; transcription factor; noucropic; neuroprotective; APP inhibitor; amyloid precursor protein inhibitor; Alzheimer's disease; beta-secretase; gamma-secretase; human; gene; ds.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The invention relates to a recombinant vector which comprises DNA, consisting of an insertion cassette contained between at least two insertion sites, that encodes a small nuclear (sn) RNA. The invention is used to identify snRNA modifications that inhibit expression of transcription products (and the identified snRNA are used to suppresse expression) for delivering antisense sequences to the nucleus and to create transgenic animals. The present DNA sequence is human snRNA, UI
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     9

The present invention describes a DNA molecule (I) that encodes a fusion protein (FP) comprising: (i) an amino acid sequence of amyloid precursor protein (FP), either the wild type, Swedish or NREV versaions; and (ii) a transcription factor (TF), fused in frame to the C-terminus of (i). Also described: (1) an expression vector containing (I); (2) a eukaryotic cell inhibits processing of APP, using the cells of (2). (I) has nootropic and neuroprotective activities. (I) can be used to produce eukaryotic cells that express FP and are useful in screening for agents that inhibit processing of APP. The agents are potentially useful for the treatment or prevention of Alzheimer's disease. Cells that express FP can screen for inhibitors of: (a) beta- and gamma secretases; and (b)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             cytoplasmic/extracellular APP signaling in a single assay. Cell-based assays may be free of interference from alpha-secretase activity and are homogeneous (no chromatography, immunoprecipitation or washing required) so well suited to high-throughput screening. The present sequence represents a plasmid nucleotide sequence from the present invention.
                                                                                                                                                                                                                                      DNA encoding a fusion protein of amyloid precursor protein, useful in screening for anti-Alzheimer agents, comprises a fused transcription
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Sequence 5015 BP; 1167 A; 1297 C; 1279 G; 1272 T; 0 U; 0 Other;

                The randomly sheared gDNA was chromatographed on Sephacryl S-400 to remove any small fragments and DNA eluting in the void volume was blunt-ended with T4 DNA Polymerase, treated with alkaline phosphatase to prevent the ligation of multiple fragments, ligated to Srf 1-digested pCR-Script Amp (SK+) vector and transformed into E. coll strain Xilo Gold. Recombinant clones from the first plating of the library were selected for sequence analysis using T3 and T7 primers."

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          788 bp mRNA linear EST 01-JUN-2004
209p08.pl AtMl Arabidopsis thaliana cDNA clone MPMGp2011P08209
5-FMHMS, mRNA sequence.
Site 2: Not1, About 1 week after bolting, cDNA synthesis using SuperscriptTM-system (Invitrogen) with an oligo (df) -primer containing Not1 restriction site and a SalI adapter. The main library (plate numbers begin with 1) of 38,000 clones was rearrayed into the sublibrary (plate numbers begin with 201) containing 5,000 putative expression clones. Average insert size is 1 kb. Note: The rearrayed sublibrary (plate numbers begin with 201) was sequenced. Library generation and sequencing was granted in context of GABI-LAPP; data are also accessible at https://gabi.rzpd.de"

Earle, 1991). The relatively small genome of rice, three times larger than that of Arabidopsis, makes it suitable for genomic studies. In order to facilitate positional cloning, physical mapping and genome sequencing of rice, we have constructed a BAC library from Oryza sativa, Nipponbare variety using EcoRI as the cloning enzyme. The library contains 55,296 clones with an average insert size of 121 Kb providing approximatley 15 haploid genome equivalents. The deep coverage allows the isolation a particular sequence with a probability of 99.9 %. Three high density filters, each containing 18,432 clones (doubly spotted), represent the whole library for colony screening and can be requested from the Clemson University BAC/EST Resource Center (www.genome.clemson.edu)."

Vertebrate homologues of C. elegans UNC-53 protein - useful for, e.g. promoting neuronal regeneration, treating chronic neuro-degenerative diseases or acute traumatic injuries.

Disclosure; Page 414-417; 479pp; English.

```
The present invention describes a vertebrate protein homologue of an UNC-
53 protein of Caenorhabditis elegans or a functional equivalent,
CC derivative or bioprecursor of UNC-53. Also described. (1) a CDNA sequence
cnooding a vertebrate homologue of the C. elegans UNC-53 protein; (2) a
cnucleic acid which hybridises to the CDNA of (1); (3) vector comprising
cc the CDNA as in (1); (4) a host cell containing the vector as in (3); (5)
ca transgenic cell, tissue or animal comprising the vector as in (3); (6)
ca compound identified as an enhancer or inhibitor of the regulation of
ccll shape, motility, or the direction of cell migration for use as a
thermagenic; (7) a method for determination of whether a protein is an
cinhibitor or enhancer of regulation of call behaviour, growth, shape or
complity or the direction of migration by contacting a host cell
complity or the direction of migration by contacting a host cell
complity or the direction of migration by contacting a host cell
complity or the direction of referemining a change of phenotype;
(8) a method for identification of vertebrate homologues of C. elegans
cunc-53 gene by hybridising a probe of 15-50 bp of the unc-53 sequence to
cc a DNA library; and (9) a method for identification of a protein which as
cc cc a DNA library; and (11) analysing such a complex to
cative in the signal transduction pathway of a cell of which a vertebrate
cc active in the signal transduction pathway of a cell of which a vertebrate
cc active in the signal integrator protein involved in controlling
cative in the directionality of cell migration and cell shape in C. elegans.
cc signal transducing or signal integrator protein involved in controlling
cdirectionality of cell migration and cell shape in C. elegans.
controllarisation or wound healing, to treat charge in electrory and controllarises of controllarises of controllarises of controllarises of controllarises of controllarises.
controllarises of controllarises of controllarises of controllarises of controllarises.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            1721 CGGTCTATTCTTTTGATTTATAAGGGATTTTGGGGATTTCGGCCTATTGGTTAAAAAAG 1780

                                                                                                             The specification describes a microsphere comprising dihydrazide derivatised hyaluronic acid crosslinked to a nucleic acid (NA). The microspheres cause reduced inflammatory responses, and have increased safety and blodegradability. The microspheres are useful for transfecting a cell of a subject and for tracting a subject having myocardial ischemia, by increasing cardiac anglogenesis. They are also useful for treating heemophilia. The present sequence represents the plasmid pCDNA:1/Gs, into which is inserted a polynucleotide sequence which is crosslinked to hyaluronic acid. The polynucleotide sequence encodes a vascular endothelial growth factor (VEGF)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The invention relates to a recombinant vector which comprises DNA, consisting of an insertion cassette contained between at least two insertion sites, that encodes a small nuclear (sn) RNA. The invention is used to identify snRNA modifications that inhibit expression of transcription products (and the identified snRNA are used to suppress expression) for delivering antisense sequences to the nucleus and to
                                                                                                                                                                                                                                                                                                                                                                                                                                       9
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               New recombinant vector containing sequence for small nuclear RNA, useful e.g. for identifying variant snRNA that suppresses expression of

                                                                                                                                                  Š
                                                                                                                                                                        셤
                                                                                                                                                                                                                                                            The protein (RP) comprising: (1) an amino acid sequence of amyloid precursor protein (RP) comprising: (1) an amino acid sequence of amyloid precursor protein (APP), either the wild type, Swedish or NFEV versions; and (ii) a transcription factor (TF), fused in frame to the C-terminus of (i). Also described: (1) an expression vector containing (I); all ewarding (I); all ewarding (I); all ewarding (I); and (3) methods for identifying a compound (A) that inhibits processing of APP, using the cells of (2). (I) has nootropic and neuroprotective activities. (I) can be used to produce eukaryotic cells that express FP and are useful in secrening for agents that inhibit processing of Alzheimer's disease. Cells that express FP can screen for inhibitors of: (a) beta- and gamma-secretases, and (b) cytoplasmic/extracellular APP signaling in a single assay. Cell-based assays may be free of interference from alpha-secretase activity and are homogeneous (no chromatography, immunopracipitation or washing required) so well suited to high-throughput screening. The present invention.

The present invention relates to polypeptides that bind cellular receptors for vascular endothelial growth factors (VEGFs), the polymucleotides encoding them, and their use for identifying agents that modulate interactions between VEGFs and their receptors. VEGFs and their receptors play an important role in vasculogenesis, the development of the embryonic vasculature from early differentiating endothelial cells and angiogenesis, the process of forming new blood vessels from premay be used to treat dysfunction of the endothelial cell regulatory system. Such disorders include cancers, abnormal angiogenesis, proliferative retinopathies, age-related macular degeneration, rheumatoid arthritis and psoriasis. The polypeptides of the invention exhibit unique receptor binding profiles compared to known naturally occurring VEGFs. The present DNA sequence for psecTagl vector is used to express VEGFs.

Also described: (1) a cDNA sequence encoding a vertebrate homologue of the C. elegans UNC-53 protein; (2) a nucleic acid which hybridises to the CDNA of (1); (3) vector comprising the cDNA as in (1); (4) a host cell containing the vector as in (3); (5) a transgenic cell, tissue or animal comprising the vector as in (3); (6) a compound identified as an enhancer or inhibitor of the regulation of cell shape, motility, or the direction of cell migration for use as a therapeutic; (7) a method for determination of whether a protein is an inhibitor or enhancer of regulation of cell behaviour, growth, shape or motility or the direction of migration by contacting a host cell expressing a homologue of UNC-53 and determining a change of phenotype;

unc-53 gene by hybridising a probe of 15-50 bp of the unc-53 sequence to a DNA library; and (9) a method for identification of a protein which is active in the signal transduction pathway of a cell of which a vertebrate homologue of UNC-53 is a component comprising; (i) contacting an extract of a cell with an antibody to the UNC-53 homologue; (ii) identifying an antibody/homologue complex; and (iii) analysing such a complex to identify any non-antibody protein bound to the complex. UNC-53 is a signal transducing or signal integrator protein involved in controlling directionality of cell migration and cell shape in C. elegans Vertebrate homologues of UNC-53 can be used to promote neuronal regeneration, revascularisation or wound healing, to treat chronic neurodegenerative diseases or acute traumatic injuries or fibrotic diseases. The present sequence is used in the exemplification of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         New isolated nucleic acid molecule comprises one or more recombination sites and one or more topoisomerase recognition sites and/or one or more topoisomerases, useful in recombinational cloning.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            9

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The invention describes an isolated nucleic acid molecule comprising at least one recombination site, and at least one topoisomerase recognition site and/or at least one topoisomerase. The isolated nucleic acid molecule is used as a vector in a host cell. It can be used directly for transfecting a cell, or as a template for performing amplification, e.g. PCR, a recombination reaction, an in vitro transcription reaction, or a coupled transcription/translation reaction. The invention allows several nucleic acid molecules to be covalently linked in a predetermined directional orientation. A functional product can be selected in vitro by performing an amplification reaction using primers specific for the termini of the desired covalently linked recombinant nucleic acid molecule. This sequence represents plasmid poDNA6.2/V5/GMD-TOPO
                                                                                                                                                                                                                                                                                                                              Isolated nucleic acid molecule useful as vector in host cell comprises at
least one recombination site, and at least one topoisomerase recognition
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    1 CGGTCTATTCTTTTGATTTATAAGGGATTTTGGGGGATTTCGGCCTATTGGTTAAAAATG

```
into the population of cells an isolated DNA construct comprising a promoter operatively linked to a targeting sequence. The method is useful in developing a sensor cell for determining the activity of a target gene in the cell. The sensor cell and the methods are useful in developing new and therapeutic drugs directed to the targets. The present sequence is a

                                                                                                                                                    that contains one or more recombination sites, one ore more topoisomerase recognition sites, and/or one or more topoisomerases. The nucleic acid sequence of the invention is useful for in vitro cloning (e.g. recombinatorial cloning) of a nucleic acid molecule. The present DNA sequence represents a plasmid vector of the invention.
                                                                                                                                      The invention comprises an isolated nucleic acid sequence (e.g. a vector)

The invention relates to an isolated nucleic acid molecule (I) comprising one or more recombination sites, and one or more nucleic acid sequences which encode an amino acid sequence tag. (I) can also comprise one or more topoisomerase recognition sites and/or one or more topoisomerases. The amino acid sequence tag is an amino acid sequence that is capable of being post-translationally modified, and is an amino acid sequence that is capable of being post-translationally modified, and is an amino acid sequence that is capable of attachment of flaving, and is an autachment of lipoic acid or attachment of flavins, and is an amino acid sequence that is capable of being biotinylated, wherein the amino acid sequence that is capable of being biotinylated is all or a portion of the Klebsiella pneumoniae oxalacetate decarboxylase a subunit, all or a portion of the Propionibacterium shermanii transcarboxylase 1.35 subunit, or all or a
                                                                                                                          New isolated nucleic acid molecules having one or more recombination sites and encoding an amino acid sequence tag, useful for recombinational and/or topoisomerase-mediated cloning methods for producing fusion
                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Example 1; Fig 11A-B; 135pp; English.

portion of the Escherichia coli biotin carboxyl carrier protein component of acetyl-CoA carboxylase. The methods and compositions of the present invention are useful for identifying, concentrating, purifying and/or producing fusion proteins that comprise an amino acid sequence tag. The nucleic acid molecules can also be used in recombinational cloning and/or topoisomerase-mediated cloning methods to produce polymucleotide constructs which encode the fusion proteins. The present sequence represents the nucleotide sequence of a plasmid pcDNA6/Biotag(TM)-D-TOPO
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                53 protein of Caenorhabditis elegans or a functional equivalent, derivative or bioprecursor of UNC-53. Also described: (1) a CDNA sequence encoding a vertebrate homologue of the C. elegans UNC-53 protein; (2) a nucleic acid which hybridises to the CDNA of (1); (3) vector comprising the CDNA as in (1); (4) a host cell containing the vector as in (3); (5)
                                                                                                                                                                                                                                                                                          9

a compound identified as an enhancer or inhibitor of the regulation of cell shape, motility, or the direction of cell migration for use as a therapear cell shape, motility, or the direction of cell migration for use as a that shape, motility or the direction of cell behaviour, growth, shape or inhibitor or enhancer of regulation of cell behaviour, growth, appe or expressing a homologue of UnC-33 and determining a change of phenotype; (8) a method for identification of vertebrate homologues of C. elegans unc-53 gene by hybridising a probe of 15-50 bp of the unc-53 sequence to a DNA library; and (9) a method for identification of a protein which is cell with an antibody to the UNC-53 homologue; (i) contacting an extract component comprising; (i) contacting an extract complex; and (iii) analysing such a complex; and (iii) analysing such a complex to attribody/homologue complex; and (iii) analysing such a complex to identify any non-antibody protein bound to the complex. UNC-53 is a signal transducing or signal integrator protein involved in controlling clirectionality of cell migration and cell shape in C. elegans. Vertebrate homologues of UNC-53 can be used to promote neuronal regeneration.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              3664 CGGTCTATTCTTTTGATTTATAAGGGATTTTGGGGATTTCGGCCTATTGGTTAAAAATG 3723
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           processing via the Major Histocompatibility Complex class I pathway and/or promotes activity of an antigen presenting cell, useful as vaccine
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        9

The invention relates to a new nucleic acid molecule (I) encoding a fusion polypeptide useful as a vaccine composition. (I) comprises a first nucleic acid sequence encoding a first polypeptide or peptide that promotes processing via the Major Histocompatibility Complex (MHC) class I pathway (MHC-I-PP) and/or promotes development or activity of an infame to the first nucleic acid sequence is linked in frame to the first nucleic acid sequence or to a linker nucleic acid sequence and encodes an antigenic polypeptide or peptide. The methods and compositions of the present invention are useful as therapeutic vaccine compositions of the present invention are useful as therapeutic vaccine compositions of the present invention are useful as therapeutic vaccine cor cancer, that cause morbidity and mortality. They can also be used in treating animal diseases, such as equine herpesvirus, bovine viruses, Marek's disease, retroviral and lentiviral diseases and rabies, in the veterinary medicine context. The present sequence represents the veterinary medicine context. The present sequence represents the

                                                                                                                                           comprising (I), expression vector, particle, cell, cell of the particle, or the chimeric polypeptide; and a carrier or excipient; (6) inducing or enhancing an antigen specific immune response by administering the composition described above; (7) increasing the number of CDB + CTLS specific for a selected desired antigen in a subject by administering the composition described above; and (8) inhibiting the growth of a tumour in a subject by administering the composition described above. (I) has cytostatic activity, and can be used in immunotherapy, and gene therapy. The nucleic acids (I), compositions and methods are useful for treating cancer. The present sequence represents a plasmid vector nucleotide
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Novel chimeric polypeptide e.g., Pseudomonas aeruginosa exotoxin A domain II/human papilloma virus-16 E7 peptide useful for inducing or enhancing antigen specific immune response, or for inhibiting growth of tumor in subject.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Translocation domain; bacterial toxin; exotoxin A domain II; ETA; major histocompatibility complex; MHC class I; vaccine; immune response; CD8+ cytotoxic I lymphocyte; CTL; tumour; E7 antigen; pcDNA3 plasmid; ds.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      9
one or more regulatory elements that enhance expression of the nucleic acid in a cell, (2) a particle comprising (1) or the expression vector; (3) a cell that has been modified to comprise (1) or the expression vector; (4) a chimeric polypeptide comprising a first domain with a translocation polypeptide, and a second domain comprising an antigen having at least one antigenic peptide; (5) a pharmaceutical composition capable of inducing or enhancing an antigen specific immune response.
                                                                                                                                                                                                                                                                                                                                                      sequence which is used in the exemplification of the present invention.

Disclosure; SEQ ID NO 8; 48pp; English.

The invention relates to nucleic acid encoding a chimeric polypeptide accomprising a translocation domain of a bacterial toxin and at least one antigenic peptide. The preferred translocation domain is domain II of Pseudomonas aeruginosa exotoxin A (ETR (dII)) and the preferred antigen is human papilloma virus type 16 (HPV-16) E7 which is a model tumour antigen. The antigenic peptide comprises an epitope that binds to and is presented on the cell surface by major histocompatibility complex (MHC) class I proteins. The nucleic acid of the invention is useful as vaccine composition for enhancing antigen specific immune response, increasing the number of CD8+ cytotoxic I lymphocytes (CTLs) and for inhibiting the growth of a tumour. The present sequence is pcDNA3 plasmid vector used in the invention.  $\overset{\alpha}{\times}\overset{\times}{\times}\overset{\circ}{\times}\overset{\overset{\circ}{\times}\overset{\circ}{\times}\overset{\circ}{\times}\overset{\circ}{\times}\overset{\circ}{\times}\overset{\circ}{\times}\overset{\circ}{\times}\overset{\circ}{\times}\overset{\circ}{\times}\overset{\circ}{\times}\overset{\circ}{\times}\overset{\circ}{\times}\overset{\circ}{\times}\overset{\circ}{\times}\overset{\circ}{\times}\overset{\circ}{\times}\overset{\circ}{\times}\overset{\circ}{\times}\overset{\overset{\circ}{\times}\overset{\circ}{\times}\overset{\circ}{\times}\overset{\circ}{\times}\overset{\circ}{\times}\overset{\circ}{\times}\overset{\circ}{\times}\overset{\circ}{\times}\overset{\circ}{\times}\overset{\circ}{\times}\overset{\circ}{\times}\overset{\circ}{\times}\overset{\circ}{\times}\overset{\circ}{\times}\overset{\circ}{\times}\overset{\circ}{\times}\overset{\circ}{\times}\overset{\circ}{\times}\overset{\overset$

treatment charvested at 0, 1, 2 and 3 days after acid
treatment. CDMA was prepared from polyA+ enriched, pooled
samples of equivalent amounts of total RNA from each time
point. The CDMA was directionally ligated into the
Uni-Zap XR vector (Stratagene) and packaged using the
Gigapack III Gold packaging extracts. Phagemids
containing cDMA inserts were in vivo excised from the
recombinant Uni-Zap XR vector using ExAssist helper phage
and the E. coli strain XII-Blue MRR' (Stratagene).
Excised plasmids were plated using SOLR cells."

/note="Vector: Lambda Zap, Seedlings were exposed either to 100 gy gamma or 0.5, 1, 5, or 10 KJ/m2 Uv irradiation. Gamma-irradiated samples were harvested at 6, 12, 24 and 48 hours after treatment. UV-irradiated samples were harvested 24 hours post-treatment. cDNA was prepared from polyA+ enriched, pooled samples of equivalent amounts of total RNA from each sample. The cDNA was directionally ligated into the Uni-Zap XR vector (Stratagene) and packaged using the Gigapack III Gold packaging extracts. Phagemids containing cDNA inserts were in vivo excised from the recombinant Uni-ZAP XR vector using ExAssist helper phage and the E. coli strain XII-Blue MRF' (Stratagene). Excised plasmids were plated using SOLR cells."
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           /tissue_type="leaf"
